

Overview

Business Logic is encoded in [Behavior Trees](#) (do check out the link, it's the nicest introduction to BTs there is). We use [BehaviorTree.CPP](#) library for this. All business logic lives in the [rtt_behavior package](#).

There's a bunch of BTs sketched out in the `docs/business-logic.cts` file ([in the same repo](#)). You can open it in [TreeSheets](#).

None of this code was ever run in production, just FYI
